Relative to claim 1, the major difference between the teachings of the referenced prior art (USP 7, 145,626, Miller et al. and Pub. No. US 2005/0035941, Albert et al.) and that of the instant invention, is that said referenced prior art 10951537/10951537

**does not teach** a display

device comprising electrophoretic particles, a display element comprising a pixel electrode and a counter electrode between which a portion of the electrophoretic particles are present, and control means for supplying a drive signal to the electrodes to bring the display element in a predetermined optical state corresponding to the image information to be displayed, characterized in that control means are further arranged for supplying a preset signal preceding the drive signal comprising a preset pulse having an energy sufficient to release the electrophoretic particles at a first position near one of the two electrodes corresponding to a first optical state, but too low to enable the particles to reach a second position near the other electrode corresponding to a second optical state, wherein the duration of the preset pulse is less than 19 msec.

***Conclusion***
